extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, new varieties of flowering plants. Other contemplated uses include, in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

```

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous

transgenic animal which exhibits a novel colour e.g. sheep with blue or transgenic animal which exhibits a novel colour e.g. sheep with blue or cred coloured fleece. They are useful for producing coloured blant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of upholstery. CFMs modify visible colour in edible and/or ornamental in sunscreens. CFMs modify visible colour in edible and/or ornamental clugal species, and in fruits and vegetables to enhance their situations of distorted light specira (Dhomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The

```
comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CPMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or coloured flaece. They are useful for producing coloured plant certactors, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional coloured transducing or intensifying an image, providing additional coloured to growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, carpression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental carporter in species and in fruits and vegetables to enhance their carbonates. CFMs modify visible colour improve image quality in situations of distorted light species (dromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           colour-facilitating molecule (CFM)

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous con-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or calculated fleece. They are useful for producing coloured plant cases include transducing or intensifying an image, providing agent. Other cuses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include. CFMs and offy visible colour in edible and/or ornamental cfungal species, and in fruits and vegetables to enhance their amental cfungal species, and in fruits and vegetables to enhance their contemplations of distorted light specira (bhomatrix). The first all-protein chromonhove in he isolated and markerial contemplated the contemplated the contemplated contemplate Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-Gaps chromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a .. 74.7%; Score 62; DB 5; Length 16; 81.2%; Pred. ```
The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

comprising a polypeptide which, in a cell, alone or together with one or

content molecules imparts an altered characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

cranspenic animal which exhibits a novel colour e.g. sheep with blue or

cractoried fleece. They are useful for producing coloured plant

cractoried ransducing or intensifying an image, providing additional

clight for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

coating materials that experience UV damage e.g. plastics and car

conting materials that experience UV damage e.g. plastics and car

conting materials phototropic organisms e.g. algae and/or corals,

conting materials plants. Other contemplated uses include,

content of markers, general reporter molecules, photon traps, UV sinks or

content or markers, general reporter molecules, photon traps, UV sinks or

content or markers, general reporter molecules, photon traps, UV sinks or

content or markers and in fruits and vegetables to enhance their

chungal species and in fruits and vegetables to enhance their

chromophore to be isolated was Green Fluorescent protein (GFP). The

sequences given in records ABP69924-ABP70048 represent CFM related amino

caid sequences. (Updated on 06-AUG-2003 to correct OS field.)
                                                                                                                                                                               Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

This sequence represents the N-terminus of Fusarium metalloprotease (MP). This sequence represents the N-terminus of Fusarium coxysporum MP p45 (see AAR77528). AAR77525 represents the consensus N-terminal sequence of the MP from F.oxysporum and Aspergillus oryzae. P45 is a new MP, and has 10 times more efficiency than Bacillus MP. Bacillus MP is more effective in cleaving primary amino groups from casein. P45 has thermolysin-like activity, and is used to cleave a pro-sequence from a recombinant proenzyme to generate an active mature enzyme. The MP may be added to, or produced in, the broth where the proenzyme is being formed by a recombinant host cell converted with a vector containing the DNA encoding p45. The MP can also be used to assay the level of activatable proenzyme in a sample. (Updated on 25-MAR-2003 to correct PA

                                                                                                                                                                                                   ó
             The N-terminal sequence (AAM05846) of Fusarium oxysporum DSM 2672 p45 metalloprotease (see also AAW05845) was identified by amino acid analysis of a protein isolated from a fermentation broth. A PCR primer based on this peptide was used, together with a primer based as a p45 internal peptide, in the PCR cloning of the p45 gene (AAT40131) from F. oxysporum genomic DNA. (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention provides the protein and coding sequences of human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         zinc finger protein 53. The sequences can be used in the treatment of cancer, haemopathy, nervous system disorders, development disorders, metabolic disorders, inflammation, immunological diseases and HIV infection. The present sequence is the N-terminus of the protein of the

immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and WHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide AMM3558 is derived from the human melanome associated protein tyrosinase which is capable of upregulating HLA-A*0201
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 0;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           493,

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence 50, A

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Authority of the tase component II - Bacillus subtilis

Surfactin synthetase component II - Bacillus subtilis

Nyllcriate names: surfactin synthetase sifA2; surfactin synthetase/competence protein surfactin synthetase sifA2; surfactin synthetase conforms: acid-amino-acid ligase (EC 6.3.2.)

C.Species: Bacillus subtilis

C.Date: 12-Aug-1996 #sequence revision 12-Aug-1996 #text change 03-Nov-2000

C.Accession: 140486; S60866; C69718; S46968; S35518; S25688; S34986

-!- CATALYTIC ACTIVITY: L-2-aminohexanedioate + L-cysteine + L-valine + 3 ATP = N-[L-5-amino-5-carboxypentanoy1]-L-cysteinyl-D-valine + 3 AMP + 3 diphosphate.
-!- COFACTOR: Contains 3 covalently bound phosphopantetheines
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  STRAIN=G191;

"Transcription initiation region of the srfA operon, which is controlled by the comP-comA signal transduction system in Bacillus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                FUNCTION: THIS PROTEIN IS A MULTIFUNCTIONAL ENZYME ABLE TO ACTIVATE AND POLYMERIZE THE AMINO ACIDS LEU, GLU, ASP AND VAL. ACTIVATION SITES FOR THESE AA CONSIST OF INDIVIDUAL DOMAINS. COFACTOR: Contains 3 covalently bound phosphopantetheines. PATHWAY: Cyclic peptide antibiotic surfactin biosynthesis. SIMILARITY: Belongs to the ATP-dependent AMP-binding enzyme
                                                "srfA is an operon required for surfactin production, competence development, and efficient sporulation in Bacillus subtilis."; J. Bacteriol. 173:1770-1778 (1991).

-!- FUNCTION. Unusual circulary permuted GTPase that catalyzes rapid hydrolysis of GTP with a slow catalytic turnover (By similarity).
-!- SUBUNIT: Monomer (Probable).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Takami H., Nakasone K., Takaki Y., Maeno G., Sasaki R., Masui N., Fuji F., Hirama C., Nakamura Y., Ogasawara N., Kuhara S., Horikoshi K.;

TISSUE SPECIFICITY: EXPRESSED IN A GRADIENT IN THE DEVELOPING LIMB BUD EPITHELIUM DURING TI PIONEER AXON OUTGROWTH.

SIMILARITY: Belongs to the semaphorin family.

SIMILARITY: Contains 1 Sema domain.

SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.

 .
 -!- FUNCTION: Involved in microtubule organization by the microtubule organizing centre, the spindle pole body (SPB). Probably part of the microtubule attachment site at the SPB.
-!- SUBCULI: Interacts with TUB4 and SPC97.
-!- SUBCELLUIAR LOCATION: Nuclear.
-!- SIMILARITY: Belongs to the GCP family.
 Geissler S., Pereira G., Spang A., Knop M., Soues S., Kilmartin J.V., Schiebel E.,

## ALIGNMENTS

```
The N-terminal peptides shown in AAY97147-48 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to clollow gene expression in transformed tissues) or general dyestuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters (both claimed)

The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

non-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

cred coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

cred produced flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

cred coloured flavouring, beverage or juice or colouring agent. Other

coating materials that experience UV damage e.g. plastics and car

cupholstery. CFMs are useful in the flower industry, in the development of

new varieties of flowering plants. Other contemplated uses include,

cred plastics and in fruits and vegetables to enhance their animo situations of distorted light spectra (biomatrix). The first all-protein

chromophore to be isolated was Green Fluorescent protein (GFP). The

sequences given in records ABB69924-ABP70048 represent CFM related amino
 Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, and car and car are all the contemplated uses include, and car are nevertable to the contemplated uses include, and car are nevertable to the contemplated uses include, and car are nevertable to the contemplated uses include, and car are nevertable to the contemplated uses include, and car are nevertable to the contemplated uses include.
 expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924.ABP70048 represent CFM related amino acid sequences. (Updated on 06-NUG-2003 to correct OS field.)

```
The invention relates to an isolated colour-facilitating molecule (CFM)

Comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

non-white light or particle emission. CPMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

light for growing photorbopic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

now varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs modify visible colour in edible and/or ornamental

turgal species, and in fruits and vegetables to enhance their

turgal species, and in fruits and vegetables to enhance their
 Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-
 marketability. CFMs embedded in a gel matrix improve image quality in

Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff. WPI; 2000-532892/48.

Claim 3; Page 42; 49pp; English.

The N-terminal peptides shown in AAY97147-48 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters

 The invention relates to an isolated colour-facilitating molecule (CFM)

Comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

coloured fleece. They are useful for producing coloured plant

coloured fleece. They are useful for producing agent. Other

cuses include transducing or intensifying an image, providing additional

light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

upholstery. CFMs are useful in the flower industry, in the development of

new varieties of flowering plants. Other contemplated uses include,

expression markers, general reporter molecules, photon traps, UV sinks or

in sunscreens. CFMs modify visible colour in edible and/or ornamental

C fungal species, and in fruits and vegetables to enhance their

marketability. CFMs embedded in a gel matrix improve image quality in

 The inventors claim recombinant penicillin acyltransferase (PAT) and DNA coding for PAT. PAT catalyses the last step in the biosynthesis of penicillin G and penicillin V. More specifically, the coding strand of the DNA has the nucleotide sequence shown below. This includes three introns and codes for a PAT protein with mol. wt. ca. 40kD. Plasmid vectors pBC2001 and pBC2002 are specifically claimed
 Sequence of fragment 19, the tryptic fragment of recombinant penicillin acyltransferase (PAT) polypeptide 2.

 New de-acetylase specific for L-N-acetyl-phosphinothricin - isolated from soil microbes, useful for stereoselective prodn. of L-phosphinothricin and for making male-sterile plants.
 οŧ
 The deacetylase has a molecular weight of 20000-100000, an optimum pH of.5-9.5 and substrate specificity for L-N-acetylphosphinothricin (L-AcPFT). It may be used for the deacetylation of AcPFT for the steroselective production of L-phosphinothricin (PPT) and for inducing reversible male serility in plants (PPT inhibits the enzyme glutamine synthase in anthers). The deacetylase comprises at least one of four sequences (See AARG1321-24). (Updated on 25-MAR-2003 to correct PN field.) (Updated on 16-OCT-2003 to standardise OS field)

immune system disease; autoimmune disease; hepatic disease; lymphoma; renal disease; inflammation; allery; Allerhimer's disease; schizophrenia; cognitive disorder; prostate disease; skeletal; cardiac; muscle disorder; pulmonary disorder; transplant rejection; osteoclast; osteoporosis;
 This invention describes novel isolated human genes and the secreted proteins they encode. The products of the invention are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polymorlectides. Specific uses are described for each of the 101 polymorlectides, which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and fetal deficiencies, blood disorders, leukemias, diseases of the immune system,
 autoimmune diseases, hepatic and renal disease, lymphomas, inflammation, allergies, Alzheimer's and cognitive disorders, schizophrenia, prostate disease, skeletal or cardiac muscle disorders, pulmonary disorders,
 transplant rejection, disorders involving osteoclasts such as osteoporosis, arthritis or malignancies, digestive/endocrine disorders, infections and AIDS. The human secreted proteins of the invention are represented in AAY07852-Y07993 and the encoding nucleic acids are

The present sequence represents an immunisation motif normally excluded, but which may be used with advantage for tolerisation by itself or in conjunction with other epitope sequences from the present invention. The present invention describes a polypeptide comprising a human myelin basic protein (HMBP) fragment including P89-101 of HMBP, excluding native HMBP. The term P89-101 is not defined but may be intended to mean amino acids 89-101 of HMBP. The polypeptide can be used for tolerising a mammalian host immune system comprising B and T cells to an immunogen of interest, wherein said immunogen is restricted by a transplantation antigen of said
 and DNA
 The inventors claim recombinant penicillin acyltransferase (PAT) and DN coding for PAT. PAT catalyses the last step in the biosynthesis of penicillin G and penicillin V. More specifically, the coding strand of the DNA has the nucleotide sequence shown below. This includes three introns and codes for a PAT protein with mol. wt. ca. 40kD. Plasmid vectors pBC2001 and pBC2002 are specifically claimed

 immune system, and for treating multiple sclenosis comprising administering a peptide derived from hMBP (human myelin basic protein). The peptide induces an autoimmune response (T cell) to a self-antigen (or part of it), and binds to an MHC (major histocompatibility complex) antigen of a host susceptible to autoimmune diseases, i.e. competes with binding to MBP and inhibit proliferation of MBP-reactive cells. The peptide has immunosuppressive and neuroprotective activity. This sequence represents a peptide derived from the human MBP protein which can be used
 Modulating or tolerizing the immune system, useful for treating multiple sclerosis, by administering a peptide derived from human myelin binding protein.
 This invention describes a novel method for modulating or tolerizing the
host. (Updated on 25-MAR-2003 to correct PF field.) (Updated on 25-MAR-2003 to correct PR field.)

 The present invention describes an isolated nucleic acid (1) encoding a nucleic acid polymerase or a derivative nucleic acid polymerase with a mucleic acid polymerase with a mutation that decreases 5.3' exonuclease activity or that reduces discrimination against dideoxynucleotide triphosphates. Also described: (1) a vector comprising the nucleic acid (1); (2) a host cell comprising the nucleic acid polymerase or its derivative; (4) a kit comprising a container containing the nucleic acid polymerase of (3); (5) making the nucleic acid polymerase of (3); (6) synthesising a DNA, (7) thermocyclic amplification of nucleic acid; and (8) primer extending a DNA. The nucleic acid (1) is useful for DNA sequencing or amplification, reverse transcription, RNA amplification or primer extension reactions. The present sequence represents a Thermus oshimai and cell contains and polymerase peptide, which is given in the exemplification of

The N-terminal peptides shown in AAV97147-48 are from pigment protein irradiation tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dyestuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters
 Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a ransgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in situations of distorted light specira (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a colour-facilitating molecule (CFM)

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or include corolouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of mew varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein current sequence represents the N-terminal amino acid sequence of a colour-facilitating molecule (CFM)

 AAR77525-R77527 represent the N-terminal sequences of a fungal metalloprotease (MP). This sequence represents the N-terminus of Fusarium oxysporum MP P45 (see AAR77528). AAR77525 represents the consensus N-terminal sequence of the MP from F.oxysporum and Aspergillus oryzae. P45 is a new MP, and has 10 times more efficiency than Bacillus MP. Bacillus MP is more effective in cleaving primary amino groups from casein. P45 has thermolysin-like activity, and is used to cleave a pro-sequence from a recombinant proenzyme to generate an active mature enzyme. The MP may be added to, or produced in, the broth where the proenzyme is being formed by a recombinant host cell converted with a vector containing the DNA encoding P45. The MP can also be used to assay the level of activity activity and is used to assay the level of activity activitable proenzyme in a sample. (Updated on 25-MAR-2003 to correct PA

ö
 Peptides AAW39430 W39734 are used in a novel method for the selection of immunogenic T-cell peptide epitopes present in polypeptide antigens. The method involves the identification of peptide sequences capable of binding to an HLA (human leukocyte antigen) class I molecule and measuring the binding of this epitope peptide to the HLA class I peptide. The stability of binding of the peptide and MHC (major histocompatability complex) class I molecule is measured on intact human B cells carrying the MHC molecule at their cell surfaces. The method can be used to select peptide epitopes for generating vaccines against a disease associated with the polypeptide, e.g. cancers or AIDS. The peptide epitopes are especially T-cell peptide epitopes with strong anti-tumour and anti-viral immune responses. Peptide AAW39598 is derived from the human melanoma associated protein tyrosinase which is capable of upregulating HLA-A*0201

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include.
 180
 expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra light spectra all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino

```

The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other ess include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketability. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Pluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino acid sequences. (Updated on 06-AUG-2003 to correct OS field.)

Мавоп Ј,

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules; imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a carracteristic sheep with blue or red coloured fleece. They are useful for producing coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other cases include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plantics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a gel matrix improve image quality in alturations of distorted light specira (blomatrix). The first all-protein contemplated in a gel matrix improve image quality in a colour or the colour in the situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-ABP70030 standard; protein; 223 AA. The invention relates to an isolated colour-facilitating molecule (CFW) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a cransgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant or ted soloured fleece. They are useful for producing agent. Other east sinclude transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car conting materials that experience UV damage e.g. plastics and car conting markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs embedded in a qel matrix improve image quality in charactions of distorted light species to enhance their and vegetables to enhance their anticons of distorted light specira (Diomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABBF09924-ABP70048 represent CFM related amino acid sequences. (Updated on 06-AUG-2003 to correct OS field.)

 cDNA libraries were constructed from a blue pigmented coral, Acropora sequences encoding polypeptides with N-terminal sequences as shown in AAV97147-48. Pigment protein from coral tissue (PPCT) is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters (both

The invention relates to an isolated colour-facilitating molecule (CFW)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

con-white light or particle emission. CFMs are useful for producing a

cransgenic animal which exhibits a novel colour e.g. sheep with blue or

cransgenic animal which exhibits a novel colour e.g. sheep with blue or

cransgenic animal which exhibits a novel colour e.g. sheep with blue or

cractions and coloured fleece. They are useful for producing agent. Other

 The invention relates to an isolated colour-facilitating molecule (CFM)

comprising a polypeptide which, in a cell, alone or together with one or

more other molecules imparts an altered visual characteristic to the cell

when visualised by a human eye in the absence of excitation by extraneous

non-white light or particle emission. CFMs are useful for producing a

transgenic animal which exhibits a novel colour e.g. sheep with blue or

red coloured fleece. They are useful for producing coloured plant

extracts, e.g. flavouring, beverage or juice or colouring agent. Other

uses include transducing or intensifying an image, providing additional

city for growing phototropic organisms e.g. algae and/or corals, for

coating materials that experience UV damage e.g. plastics and car

cupholstery. CFMs are useful in the flower industry, in the development of

new varieties of flowering plants. Other contemplated uses include,

captression markers, general reporter molecules, photon traps, UV sinks or

conting markers, general reporter molecules, photon traps, UV sinks or

conting species, and in fruits and vegetables to enhance their

cundal species, and in fruits and vegetables to enhance their

chromophore to be isolated was Green Fluorescent procein (GFP). The

chromophore to be isolated was Green Fluorescent procein (GFP). The

sequences given in records ABP69924-ABP70048 represent CFM related amino

## ALIGNMENTS

```
The N-terminal peptides shown in AAV97147-48 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to clollow gene expression in transformed tissues) or general dyestuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters
 Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.

 The N-terminal peptides shown in AAY97151-52 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, increscent marker (e.g. to follow gene expression in transformed tissues) or general dyscutf (all claimed). PPCT may also be used in sunscreen formulations or UV filters
 Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.
 N-terminal; pigment protein from coral tissue; PPCT; fluorescence;
tissue marker; fluorescent marker; dyestuff; sunscreen; ultra violet;

The N-terminal peptides shown in AAY97151-52 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700
 Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.
 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dyestuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters (both claimed)

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other extracts, e.g. flavouring, beverage or juice or colouring agent. Other cuses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car conting materials that experience UV damage e.g. plastics and car conting materials that experience UV damage e.g. plastics and car conting materials plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their marketablity. CFMs embedded in a gel matrix improve image quality in situations of distorted light spectra (biomatrix). The first all-protein
 Novel color-facilitating molecule for producing a biomatrix, has a polypeptide which alone/along with molecules imparts altered visual characteristics to cells in the absence of excitation by extraneous non-
 chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino

The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell when visualised by a human ey in the absence of excitation by extraneous on-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or red coloured fleece. They are useful for producing coloured plant care useful for producing ocloured plant care uses include transducing or intensifying an image, providing additional light for growing phototropic organisms e.g. algae and/or corals, for the coating materials that experience UV damage e.g. plactic and care upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs endify visible colour in edible and/or ornamental chungal species, and in fruits and vegetables to enhance thair all propersion markets all and plants. Other contemplated uses include, marketablity. CFMs embodded in a gel marrix improve image quality in marketablity. The marrix improve image quality in marketablity.
 situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The sequences given in records ABP69924-ABP70048 represent CFM related amino

WPI; 2000-532892/48.

Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.

Claim 3; Page 42; 49pp; English.

The N-terminal peptides shown in AAY97147-48 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters

 The invention relates to an isolated colour-facilitating molecule (CFM) comprising a polypeptide which, in a cell, alone or together with one or more other molecules imparts an altered visual characteristic to the cell more other usualised by a human eye in the absence of excitation by extraneous non-white light or particle emission. CFMs are useful for producing a transgenic animal which exhibits a novel colour e.g. sheep with blue or ed coloured fleece. They are useful for producing coloured plant extracts, e.g. flavouring, beverage or juice or colouring agent. Other uses include transducing or intensifying an image, providing additional collish for growing phototropic organisms e.g. algae and/or corals, for coating materials that experience UV damage e.g. plastics and car upholstery. CFMs are useful in the flower industry, in the development of new varieties of flowering plants. Other contemplated uses include, expression markers, general reporter molecules, photon traps, UV sinks or in sunscreens. CFMs modify visible colour in edible and/or ornamental fungal species, and in fruits and vegetables to enhance their

 The invention relates to the identification of complementary peptides by analysis of protein and nucleotide sequence databases from higher eukaryotic genomes, excluding human and plants. The specific complementary peptides interact with their relevant target proteins encoded in the eukaryote genome. The peptides may be used as reagents and drugs for drug discovery and as lead ligands for drug design and development. The present sequence is a complementary peptide from
situations of distorted light spectra (biomatrix). The first all-protein chromophore to be isolated was Green Fluorescent protein (GFP). The current sequence represents the N-terminal amino acid sequence of a colour-facilitating molecule (CFM)

 The N-terminal peptides shown in AAY97151-52 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and maximal fluorescence emission is in the range of 11m. PPCT may be used as a tissue marker, fluorescent marker (e.g. to follow gene expression in transformed tissues) or general dysetuff (all claimed). PPCT may also be used in munscreen formulations or UV filters
 Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.

 The N-terminal peptides shown in AAY97151-52 are from pigment protein from coral tissue (PPCT). PPCT is capable of emitting fluorescence upon irradiation by incident light whose maximal absorbance is in the range of 320-600 nm and a maximal fluorescence emission is in the range of 300-700 nm. PPCT may be used as a tissue marker, fluorescent marker (e.g. to close follow gene expression in transformed tissues) or general dyestuff (all claimed). PPCT may also be used in sunscreen formulations or UV filters (both claimed)
 The invention relates to a human Cdc5 (hCdc5) protein. The hCdc5 cDNA is useful in the therapy of pathologies such as diseases, syndromes, or other undesirable conditions resulting from defects in cell cycle progression which may result from hCdc5 gene, in the regulation of the expression of the hCdc5 gene or in a step downstream of hCdc5 in the regulation of cell cycle progression through G2 and entry into mitosis. It is useful for treating a patient having a hyperproliferative disease such as cancer, coronary artery disease, pulmonary vascular obstructive disease, and other disorders of abnormal cellular proliferation (see AAB61997 for various used of the hCdc5 gene). The present sequence represents a fragment of the c-myb protein, used for amino-terminal
Novel pigment protein derived from corals capable of emitting fluorescence upon irradiation by incident light useful as tissue marker, fluorescent marker or general dyestuff.
 Novel nucleic acids comprising human Cdc5 gene useful in gene therapy techniques for treating diseases related to cell cycle defect such as cancer, coronary artery disease, pulmonary obstructive vascular disease.

 The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed senses. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating disorders polypeptide and polynucleotide sequences have applications in properties.
 diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic patent did not appear in the printed specification, but was obtained in ftp.wipo.int/pub/published_pct_sequences

New protein from Neisseria gonorrheae, useful for the manufacture of a medicament for treating or preventing N. gonorrheae infection.

The present invention relates to proteins from Neisseria gonorrhoeae. Also disclosed are the nucleic acid molecules encoding the proteins and antibodies that specifically bind to the proteins. The composition comprising the protein, nucleic acid or antibody is useful for the manufacture of a medicament for treating or preventing N. gonorrhoeae infection, this may be in the form of a vaccine or gene therapy. Sequences given in records ABP76736-ABP81046 represent nucleic acid
